

LB Commission Calculator

Step-by-step user guide · Generated 2026-05-08

App URL	https://lb-sales-commission.streamlit.app
Password	Lbitesa88
Source data	EasyStore order export (.csv)
Output	Multi-sheet Excel report (.xlsx)

What this guide covers: the full monthly workflow — from downloading the EasyStore CSV, through reviewing parsed orders and fixing flagged items, to downloading the final commission Excel for finance.

Read once end-to-end. After the first run you will only need this guide for the unusual cases.

Part 1 · Download the EasyStore CSV

Step 1 · Sign in to EasyStore

Open admin.easystore.co in a browser and sign in with your EasyStore admin account.

Step 2 · Go to Orders → Export

- In the left sidebar, click **Orders**.
- Top-right of the orders table, click **Export**.
- Choose the date range for the month you are running commission for. (Easiest: pick the first to the last day of the previous calendar month.)
- Leave the format on **CSV**.
- Click **Export**. EasyStore will email you the file or download it directly — usually within a minute.

Step 3 · Save the CSV somewhere you'll find it

The file will be named something like `Export_Orders_YYYYMMDD_HHMMSS.csv`. Keep it in your **Downloads** folder — the next part uploads it directly.

Part 2 · Open the Commission Calculator

Step 4 · Open the app

In Chrome, go to <https://lb-sales-commission.streamlit.app>

Tip: bookmark this URL so you don't have to type it every month.

Step 5 · Sign in with the shared password

- You will see a sign-in box. Enter the password: **Lbitesa88**
- Click **Sign in**.

Do not share the password publicly. If a colleague leaves the team, ask the admin to rotate the password.

Part 3 · Upload the CSV and review

Step 6 · Upload the CSV

- Make sure you are on the **Upload & Review** page (selected by default in the left sidebar).
- Click the **Upload** button under the heading **EasyStore order export (CSV)**.
- Select the CSV you downloaded earlier and click **Open**.
- You will see a green message confirming how many rows were loaded.

Step 7 · Set the date range

Just below the upload box, two date fields appear: **From** and **To**. By default they point to last calendar month. Adjust if you need a different period.

Important: the date filter uses the order's *Date* column from EasyStore. Orders outside this range will not appear in any tab.

Step 8 · Read the four metric cards

Across the top you will see four numbers:

Orders in range	How many orders fall in the date range
Parsed cleanly	Orders that were fully understood by the engine
Need review	Orders the engine couldn't fully cost — you must check
Excluded	Cancelled or unpaid orders (no commission impact)

Step 9 · Skim the Parsed orders tab

This is the default tab. Each row is one order. Confirm:

- The SA(s) column shows the right name(s) and percentages.
- The Payments column shows the methods you expect (cash, card, etc.).
- The Net column matches your expectation for that order.

If a single row looks wrong, check the seller note in EasyStore for that order — usually a typo in the note.

Step 10 · Fix anything in the Review queue

Click the **Review queue** tab. Anything here needs your attention before the report is correct.

For each order:

- Click the order's row to expand it.
- Read the seller note shown at the top of the expanded row.
- In the **Sales Advisor** table, set the right SA name(s) and share %. Shares must total 100.
- In the **Method / Last 4 / Amount / Foreign** table, fix the payment details. The Amount column should sum to the order total.
- Click **Save override**. The order is now corrected for this run.

Overrides apply to **this session only**. If you re-upload the CSV or close the browser, the corrections must be redone. The fix is to ask the SA to update the seller note in EasyStore for next month.

Step 11 · Glance at the Excluded tab

Orders here are **not** in the report. Common reasons: cancelled by customer, unpaid, or not yet fulfilled. If something is excluded that should count, fix the order's status in EasyStore and re-export the CSV.

Part 4 · Generate the Commission Report

Step 12 · Switch to the Commission Report page

In the left sidebar, click **Commission Report**.

Step 13 · Read the top metrics and bar chart

- Four header metrics: SAs with sales / total gross / total net / total commission.
- Bar chart shows net sales by SA at a glance.

Step 14 · Review each SA's card

Below the chart, each Sales Advisor has their own card showing:

- Tier label (e.g. *RM 0 – RM 200,000 @ 0.8%*)
- Order count and average order value
- Gross / Net totals
- Commission earned for the month

Click **Order-by-order breakdown** to expand the per-order detail. The seven columns are:

1	Order #	EasyStore order number
2	Date	Order date
3	Share %	How much of this order belongs to this SA
4	Gross share	Order gross × share %
5	Charges	SA's slice of the bank/SenangPay fees
6	Net share	Gross share − charges
7	Payment method	Compact summary of all payment portions

Step 15 · Check the House sales section

Below the SA cards, a **House sales (COMPANY SALES — no commission)** section shows orders attributed to the house account. These are tracked for revenue visibility but earn no commission.

Step 16 · Download the Excel report

- Scroll to the bottom of the Commission Report page.
- Click the **Download Excel Report** button.
- The file is named `commission_report_YYYYMMDD_HHMMSS.xlsx`.

The Excel workbook has multiple sheets:

- **Summary** — one row per SA plus a totals row, plus a House row at the bottom.
- **SA – <Name>** — one sheet per SA with full audit trail (every order, every payment portion, the rate row applied, the charge, the net, the SA's share).
- **House – COMPANY SALES** — equivalent audit trail for house orders.
- **Review log** — orders that needed manual fixing this run.
- **Excluded** — orders excluded by the cancelled/unpaid filter.

- **Settings snapshot** — SA list, tier brackets, channel flat rules, and the rate table version used. Useful for audit.

Step 17 · Sign out (optional)

On a shared computer, click **Sign out** in the left sidebar before leaving. On your own laptop, you can leave the session open.

Part 5 · Common questions

What does “Need review” mean exactly?

The engine couldn't confidently parse the seller note. Common causes:

- The SA name is misspelled in the note.
- The payment method is ambiguous (e.g. just *SENANGPAY* with no card/FPX hint).
- Multiple payment portions in the note don't add up to the order total.

House-only orders (100% COMPANY SALES) with parser issues are **not** shown here, because they don't affect any SA's commission.

Why is an order missing from the report?

- It's outside the date range you set.
- It's *Cancelled* or unpaid — check the **Excluded** tab.
- Its calculated net = RM 0 (typically empty notes or RM 2.00 test orders). These are dropped silently to keep the report clean.

Why does the Net column not match the order total?

Net = Gross – bank/SenangPay charges. Cards incur 0.45% – 2.5% depending on scheme; bank transfers, cash, trade-ins, MyDebit, TouchNGo and TikTok incur 0% in our rate setup.

Why does TikTok-shop look different?

TikTok orders use the seller-note amount as net (already after TikTok's platform fee), and earn a flat **RM 10 per order** commission instead of the percentage tier.

The seller wrote the wrong amount in the note — what happens?

The engine trusts the EasyStore-calculated **Total Amount** column over the typed amount. So if the note says *CASH RM750* but the order total is RM 950, the engine will record cash = RM 950 automatically.

The bank rate changed — how do I update?

Go to the **Settings** page in the app → **Card rates** tab. Either edit the active rate version, or click **Add new version** with a new *effective from* date so historic months use the old rates.

On Streamlit Cloud's free tier, edits made through the Settings page do not survive the next redeploy. The admin should also edit `data/rates.json` in the GitHub repo and push, so the rate persists.
